API website Docs: https://dummyjson.com/docs/products

An eCommerce project involves creating an online platform that facilitates the buying and selling of goods or services over the internet. Here's a breakdown of essential components and functionalities typically found in an eCommerce project:

1. User Authentication and Profiles:

  - User login system.

  - User profiles for personal information.

2. Product Catalog:

  - Display of products with details, including images, descriptions, prices.

  - Categorization and filtering options for easy navigation.

  - single product page with product rating. **(Display product comments are BOUNS)**

3. Search:

  - Search functionality allowing users to find products based on keywords.

4. Shopping Cart:

  - Functionality to add items to the cart (on the fly).

  - Calculating total amount.

  - Option to modify quantities or delete items. **(BOUNS)**

6. Responsive Design: (BOUNS)

  - Ensuring the platform is accessible and functional across various devices (desktops, tablets, mobile phones).

Building an eCommerce project involve a combination of front-end development (HTML/CSS/JavaScript).
